Butkov does what physics teachers do. He cuts out the nonessential things a math professor would teach and tells you what you need to know to use the methods. Many physics authors are so afraid of being corrected over tiny points of rigor, they include a lot of stuff which serves no purpose except to confuse.

The theory of partial differential equations (and the related areas of variational calculus, Fourier analysis, potential theory, and vector analysis) are perhaps most closely associated with mathematical physics. These were developed intensively from the second half of the 18th century (by, for example, D'Alembert, Euler, and Lagrange) until the 1930s.

Mathematical physics - Wikipedia

Almost every chapter begins with an example or discussion of elementary nature. Following a discussion of the fundamentals, the text is almost entirely devoted to linear problems, but the unifying concepts of linear space are fully developed after the student is exposed to a number of practical mathematical techniques.

CHAPTER 3. EXERCISE SOLUTIONS 17. so the second summation reduces to $(-1)^p + (p+1)! \cdot 1 \cdot n+p+1$, as required. Our proof by mathematical induction is now completed by observing that the partial-fraction formula is correct for the case $p=0$. 1.5.3. The formula for $u_n(p)$ follows directly by inserting the partial fraction decomposition.
