The most common oil ratio is 8 oz. per gallon, which is 16 parts fuel to 1 part oil also known as 16:1. If you mix 6 oz. per gallon you are now at 21 parts fuel and 1 part oil. The 16:1 ratio has less fuel in it than the 21:1 ratio. So when at 16:1 you may need a larger jet than when you run the 21:1 ratio.

Mix fuel and oil after the temp has been elevated. The only way to make sure this doesn't happen, is to make sure the fuel is above 50 degrees.

From our experience it is best if you notice that the fuel coming out of the fuel line is milky to drain it back into the jug and try to elevate the temp of the the fuel out of the kart.
