Energy from the sun enters an ecosystem when a plant uses sunlight to make sugar molecules by a process called photosynthesis. During photosynthesis, plants, algae, and some bacteria capture solar energy. Solar energy drives a series of chemical reactions that require carbon dioxide and water. The result of photosynthesis is the production of sugar

Ecosystems
Answer Key

Webs Energy flows through an ecosystem in one direction from primary producers to various consumers. A food chain is a series of steps in which organisms transfer energy by eating and being eaten.

Producers, such as floating algae called phytoplankton, are at the base of every food chain. A food web is a network of all the food chains in an
