In the United States, the lifetime prevalence rate of OCD is estimated at 2.3% in adults and around 1%-2.3% in children and adolescents. How OCD impairs memory and learning in children and adolescents:

- Children and adolescents with OCD often have trouble concentrating and completing tasks.
- They may avoid activities or situations that trigger their obsessions or compulsions.
- OCD can also lead to social isolation and school problems.
- Treating OCD in children and adolescents is crucial for improving their quality of life.
